Hi there,

I'm reaching out as I'm excited about the Machine Learning Engineer role at your company. I've got 6 years of professional experience (ML 5 yrs), and I'm passionate about all things ML, especially computer vision, NLP, and recommendation systems.

My expertise lies in processing large datasets and using suitable ML models to predict desired outcomes.

My last company where I worked for 5 yrs was a silicon valley based healthcare startup where I joined as one of the founding engineers. I built ML models for various healthcare applications such as predictive analysis and medical imaging analysis.

I'm good with TensorFlow and PyTorch for building and tweaking deep learning models.

I've built and deployed neural networks for all sorts of things - computer vision, NLP, Recommendation systems and Reinforcement Learning.

I know how to set up ML pipelines that can handle a lot of data.

I can make models run faster and more efficiently.

I'm really interested in the cutting-edge stuff like LLMs and multimodal models.

I love working in startups because things move fast and you can make a big impact. I'm excited to bring my skills and energy to your team and help build something amazing.

Looking forward to chatting more about how I can help your company succeed!
